## DVDMovieFactory SE for Hitachi DVD video camera / recorder

### Editing Moving Images

---

1. Captured moving video images, video clips are placed at Video Strip and select the clip to edit as below. When clicking "Play clip", you can play a video clip scene.

2. If cutting video clip at any point, use the scissors icon. To adjust the point you wish to cut the clip use these buttons.

 : Stop Play     : Go to previous edit point     : Go back to previous frame  
 : Go to next frame     : Go to next edit point     : Play clip continuously  
 : Current Position (Click it to adjust)

(a) For example below, if I decided to cut the clip at 4.20 seconds from the beginning, click the scissors icon "Cut video clip"

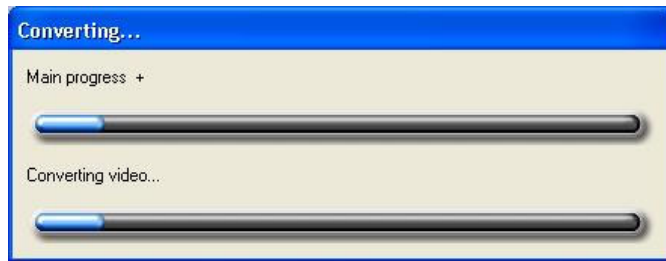

(b) The video clip split at the point and it becomes 2 video clips. In the example, ezs021030-002.MPG is split to ezs021030-002\_1.MPG (clip up to 4.20 seconds) and ezs021030-002\_2.MPG (clip after 4.20 seconds). Additionally, I made another clips splitting ezs021030-002\_1.MPG into ezs021030-002\_1\_1.MPG and ezs021030-002\_1\_2.MPG.

3. When editing is finished, a movie file can be created. In the example, selecting ezs021030-002\_1\_2.MPG and ezs021030-002\_2.MPG, click "Make movie" icon to combine the two clips to create one moving image file. (In the example, selected DVD-VR format is selected and named 'sample.mpg'.)

4. When the movie image file is created, the dialog box as below appears as below showing "Export" tabsheet. (If you are not finished editing yet, select "Edit" tabsheet to work)
